

# Disaster Recovery

## An Introduction.

By, Liam Hogan

Disasters can be very harmful to your network...if not properly prepared. These Disaster Recovery booklets are going to cover most common disasters and how you should plan and how to recover from them successfully.

A few ways you could start to accomplish this, keep backups off site from your work place, get a procedure to back your data up every determined number of days. (Usually 14-30 days.) Have plan.

These are just three get your toes in the water steps you can take to easily recover from said Disaster. What disaster? Well, depends what we call a disaster. Could be fire, power outage, power surge or bad weather.

These are just a few that could happen. These handbook are for your use and knowledge and to help you prepare, each book will be on a different disaster. Here is an overview of the books to come, this series will keep with new books until we run out of disasters to recover from. I have come up with a Color Code System, feel free to use different colors but these are the ones I use. Red is full meltdown, Blue, is not as bad but you are still using those back ups, Yellow is not bad at all just need to re-write lines of code and you are back to work and

White the power went out, just turn everything back on.

You can edit the meaning of the different colors and even the colors this is just a basic 4 color code system so you are able to identify the disaster and know what you need to do.

Handbooks coming up:

Disaster Recovery  
An Introduction

Disaster Recovery  
Book one:  
Power Outages

Disaster Recovery  
Book Two:  
Recovering from Fires

Disaster Recovery
